Name: **Reg. No:**

CHRIST (Deemed to be University)

Department of Computer Science

5MCA A & B Applied Machine Intelligence (MCA524-5)

CIA TEST – 1

Maximum Marks: 40

Time: 2 Hrs

CO1: Understand the fundamentals of reinforcement learning and representation learning.

CO2: Develop effective feature representations using deep learning architectures for different types of data.

General Instructions

1. The test consists of three debugging questions based on:
    - Q-Learning using FrozenLake (Mandatory) (CO 1)
    - CNN (CO 2) (or)
    - LeNet-5 (CO 2)
2. Attempt any one: Either CNN or LeNet-5 debugging questions.
3. Each debugging question carries 15 marks.
4. Each program contains errors.
    - 1 correctly identified and corrected error = 1 mark
5. Students must:
    - Identify the errors in the given program.
    - Correct the errors without completely rewriting the program.
    - Execute the corrected program successfully.
    - Verify and demonstrate the expected output.
6. The debugging programs (provided ipynb files) are to be executed offline. No internet access will be provided during the examination.
7. The required software and Python libraries must be installed and tested before the examination.

After completing the debugging task, students will write a test based on the errors present in the program they have attempted. (Last 15 Minutes)
